

AI-generated visual direction, not implemented software. Typography and microcopy in artwork are exploratory.

Assembly

Precise. Playful. Clearly yours.

A strong graphic system: oversized type, porcelain forms, vermilion planes and a small cobalt signal. The making of the Fold becomes the visual story.

Bold condensed grotesk for the largest titles;
readable system sans for instructions; system mono
for precise data.

Visual principle

Six ribbons become one sculpture. They represent the object's geometry, never six verified peers or six people.

Motion

Align → Fold → Belong. A decisive 650–900 ms assembly with a gentle finish. Short, tactile press feedback. Reduced motion uses a simple crossfade.

Keep it disciplined

Do not carry poster-scale type into instructions or consent. Avoid extra Pause/Keep running decisions that complicate the accepted automatic journey.

Build effort

Lowest to moderate. Strong typography, vector geometry and a prepared sequence of object renders can carry the experience without a complex live scene.

Same steps. Stronger character.

01 / Connect

Two simple circles align. Verification stages get a clear marker and a stable label; color never carries the state alone.

02 / Reveal

The separated ribbons assemble into the Fold. A large token number and a restrained receipt label appear after confirmation.

03 / Handoff

Graphic energy quiets down. Pair the two app windows, compare numeric fingerprints and present one explicit approval action.

Rules shared by all three directions

- The accepted journey stays intact. Launch automatically connects; there is no new “Keep running” gate or second claim introduced by a concept button.
- Use “Verifying this app”, “Connecting to a peer”, “Receipt confirmed” and “Preparing your Fold” for distinct real states. A rendering delay is not a network failure.
- The consent screen always compares numeric key fingerprints and explains the account-control change. The user signs their own copy; they do not transfer their NFT to another developer.
- Never imply verified human identity, invent peer counts, or use the Fold’s six ribbons as a peer count. Artwork captions remain exploratory; these rules govern implementation.
- Body and control text must stay readable at normal size. Keep status visible in words as well as color. Honor Reduce Motion; idle scenes should settle and stop consuming resources.
- Start with a static native screen, then add a bounded reveal. Reuse the real procedural Fold renderer; these new concept shapes are not replacement minted NFT images.
